The evolution of flowers and seed protected in a fruit led to the next branch, the angiosperms. The production of flowers and fruits has a cost, but this cost is outweighed by the benefits. And many adaptations have led to diverse types of flowering plants. Along with these new information-gaining changes, many intricate symbiotic relationships supposedly developed. Many exclusive symbiotic

Thus, a complete understanding of angiosperm evolution must include fossil evidence from both plants and insects. Stebbins (1981) argued that insect pollinators probably did not play a significant role early on in angiosperm evolution, although they were likely to have had a selective role for bisexual flowers later on.
